## 1.0 Overview

This repo provisions a complete, production-grade private networking topology that connects AWS workload VPCs to Confluent Cloud Enterprise Kafka clusters using **Private Network Interface (PNI)**, Confluent's next-generation private connectivity model that replaces PrivateLink with customer-owned ENIs placed directly in your VPCs.

The architecture follows a **Hub-and-Spoke** pattern:

- A **PNI Hub VPC** owns the ENIs registered with Confluent Cloud and serves as the centralized private connectivity anchor.
  - **PNI Spoke VPCs** (sandbox, shared) each host a Confluent Cloud Enterprise Kafka cluster and peer connectivity through the hub via AWS Transit Gateway.
  - All VPCs are stitched together through an existing **AWS Transit Gateway (TGW)**, enabling a VPN-connected developer/operator to reach Confluent Cloud endpoints without traversing the public internet.
-

## 4.0 Prerequisites

This project assumes you have the following prerequisites in place:

- Client VPN, Centralized DNS Server, and Transit Gateway
- Terraform Cloud Agent

### 4.1 Client VPN, Centralized DNS Server, and Transit Gateway

```

#### 4.1.1 Key Features Required for Confluent PNI to Work

##### 4.1.1.1 Hub-and-Spoke Network Architecture via Transit Gateway

- Transit Gateway serves as the central routing hub connecting all VPCs
- Disabled default route table association/propagation for explicit routing control

- DNS support enabled on the TGW (`dns_support = "enable"`)
- Custom route tables for fine-grained traffic control between VPCs

#### 4.1.1.2 Client VPN Integration

- Mutual TLS authentication using ACM certificates (server + client)
- Split tunnel configuration for routing only Confluent traffic through VPN
- Authorization rules controlling which CIDRs VPN clients can access
- Routes added to VPN endpoint for all workload VPC CIDRs via Transit Gateway

#### 4.1.1.3 Cross-VPC Routing

- TGW attachments for: VPN VPC, DNS VPC, TFC Agent VPC, and all Workload VPCs
- Route tables in each VPC with routes to other VPCs via TGW
- Workload VPC CIDRs aggregated and distributed to VPN client routes

#### 4.1.1.4 Security & Observability

- Dedicated security groups per component (VPN endpoint, etc.)
- VPC Flow Logs and TGW Flow Logs to CloudWatch
- VPN connection logging for audit trails
- IAM roles with least-privilege for flow log delivery

## 4.2 Terraform Cloud Agent

#### 4.2.1 Key Features Required for Confluent PNI to Work (TFC Agent Configuration)

##### 4.2.1.1 Custom DHCP Options for DNS Resolution

- DHCP Options Set configured with **dual DNS servers**: VPC default DNS (`cidrhost(vpc_cidr, 2)`) AND centralized DNS VPC resolver IPs
- Region-aware domain name configuration (`ec2.internal` for us-east-1, `{region}.compute.internal` for others)
- Associates TFC Agent VPC with custom DHCP options to route Confluent domain queries to the central DNS infrastructure

##### 4.2.1.2 Transit Gateway Connectivity

- TFC Agent VPC attached to shared Transit Gateway with DNS support enabled

- Explicit route table association and route propagation (not using TGW defaults)
- Routes added from private subnets to: DNS VPC, and Client VPN VPC
- Flattened route map pattern (`for_each`) ensures routes are created for every workload VPC CIDR

4.2.1.3 Security Group Configuration for Kafka Traffic

- **TFC Agent Security Group** with egress rules for:
  - HTTPS (443) and Kafka (9092) to each workload VPC CIDR
  - DNS (UDP/TCP 53) to DNS VPC CIDR specifically
  - General HTTPS/HTTP for Terraform Cloud API and package downloads

4.2.1.4 AWS VPC Endpoints for Private Service Access

- **Interface endpoints** with private DNS enabled for: Secrets Manager, CloudWatch Logs, ECR API, ECR DKR
- **S3 Gateway endpoint** (required for ECR image layer pulls)
- Dedicated security group for VPC endpoints allowing HTTPS from within VPC
- Eliminates NAT Gateway dependency for AWS service calls

4.2.1.5 ECS Fargate Deployment Pattern

- TFC Agents run in private subnets with `assign_public_ip = false`
- NAT Gateways per AZ for outbound internet (Terraform Cloud API communication)
- Agent token stored in Secrets Manager, fetched via VPC Endpoint
- Container health checks and deployment circuit breaker for reliability

4.2.1.6 IAM Permissions for Infrastructure Management

- Task role with Transit Gateway, VPC, Route53 Resolver, and Client VPN management permissions
- Execution role with Secrets Manager access for agent token retrieval
- KMS permissions scoped to Secrets Manager service for encryption/decryption

4.2.1.7 Network Architecture Summary

- **Hub-and-spoke model:** TGW connects TFC Agent VPC → DNS VPC → Workload VPCs

---

# 5.0 Configuration

All sensitive values are passed as environment variables (never stored in `.tfvars`). The `deploy.sh` script handles setting `TF_VAR_*` exports automatically after AWS SSO authentication.

## 5.1 Key Input Variables

Variable	Description
<code>tgw_id</code>	Existing Transit Gateway ID
<code>tgw_rt_id</code>	Transit Gateway Route Table ID

Variable	Description
vpn_vpc_id	VPN VPC ID
vpn_vpc_rt_ids	Comma-separated VPN VPC route table IDs
vpn_endpoint_id	AWS Client VPN Endpoint ID
vpn_target_subnet_ids	Comma-separated VPN associated subnet IDs
tfc_agent_vpc_id	Terraform Cloud Agent VPC ID
tfc_agent_vpc_rt_ids	Comma-separated TFC Agent VPC route table IDs
eni_number_per_subnet	Number of ENIs per subnet (default: 17)
aws_region	AWS region for all resources

5.2 CIDR Allocations

Network	CIDR
PNI Hub VPC	10.3.0.0/20
Sandbox Spoke VPC	10.0.0.0/20
Shared Spoke VPC	10.1.0.0/20

All VPCs use 3 subnets across 3 AZs with /4 new bits of sub-netting.

6.0 Deployment

6.1 Create

```
./deploy.sh create --profile=<SSO_PROFILE_NAME> \
    --confluent-api-key=<CONFLUENT_API_KEY> \
    --confluent-api-secret=<CONFLUENT_API_SECRET> \
    --tfe-token=<TFE_TOKEN> \
    --tgw-id=<TGW_ID> \
    --tgw-rt-id=<TGW_RT_ID> \
    --tfc-agent-vpc-id=<TFC_AGENT_VPC_ID> \
    --tfc-agent-vpc-rt-ids=<TFC_AGENT_VPC_RT_IDS> \
    --vpn-vpc-id=<VPN_VPC_ID> \
    --vpn-vpc-rt-ids=<VPN_VPC_RT_IDS> \
    --vpn-endpoint-id=<VPN_ENDPOINT_ID> \
    --vpn-target-subnet-ids=<VPN_TARGET_SUBNET_IDS> \
    --pni-hub-vpc-cidr=<PNI_HUB_VPC_CIDR>
```

Here's the argument table for `deploy.sh create` command:

Argument	Required	Placeholder	Description
----------	----------	-------------	-------------

Argument	Required	Placeholder	Description
<code>--profile</code>	✓	<code>&lt;SSO_PROFILE_NAME&gt;</code>	AWS SSO profile name used to authenticate via <code>aws sso login</code> and derive the AWS region and account ID for the session.
<code>--confluent-api-key</code>	✓	<code>&lt;CONFLUENT_API_KEY&gt;</code>	Confluent Cloud API key used by Terraform to authenticate against the Confluent provider.
<code>--confluent-api-secret</code>	✓	<code>&lt;CONFLUENT_API_SECRET&gt;</code>	Confluent Cloud API secret paired with the API key for Terraform provider authentication.
<code>--tfe-token</code>	✓	<code>&lt;TFE_TOKEN&gt;</code>	Terraform Enterprise/Cloud (TFE/TFC) API token used to authenticate the Terraform Cloud Agent with the TFC control plane.
<code>--tgw-id</code>	✓	<code>&lt;TGW_ID&gt;</code>	AWS Transit Gateway ID (e.g., <code>tgw-xxxxxxxxxxxxxxxxxx</code> ) that serves as the central hub routing traffic between the TFC Agent VPC, VPN VPC, and the PrivateLink Network Interconnect (PNI) Hub VPC.
<code>--tgw-rt-id</code>	✓	<code>&lt;TGW_RT_ID&gt;</code>	AWS Transit Gateway Route Table ID (e.g., <code>tgw-rtb-xxxxxxxxxxxxxxxxxx</code> ) to which routes are added for inter-VPC traffic through the Transit Gateway.
<code>--tfc-agent-vpc-id</code>	✓	<code>&lt;TFC_AGENT_VPC_ID&gt;</code>	VPC ID of the VPC hosting the Terraform Cloud Agent (ECS Fargate). This VPC is attached to the Transit Gateway for connectivity to the Confluent Private Network.
<code>--tfc-agent-vpc-rt-ids</code>	✓	<code>&lt;TFC_AGENT_VPC_RT_IDS&gt;</code>	Comma-separated list of route table IDs within the TFC Agent VPC. Routes to the PNI Hub VPC CIDR are injected into these tables to enable PrivateLink reachability.
<code>--vpn-vpc-id</code>	✓	<code>&lt;VPN_VPC_ID&gt;</code>	VPC ID of the VPC where the Client VPN endpoint is deployed, allowing operator/admin connectivity into the private network.

Argument	Required	Placeholder	Description
<code>--vpn-vpc-rt-ids</code>	✓	<code>&lt;VPN_VPC_RT_IDS&gt;</code>	Comma-separated list of route table IDs within the VPN VPC. Routes to the PNI Hub VPC CIDR are added here so VPN-connected clients can reach Confluent Private Network.
<code>--vpn-endpoint-id</code>	✓	<code>&lt;VPN_ENDPOINT_ID&gt;</code>	AWS Client VPN Endpoint ID (e.g., <code>cvpn-endpoint-xxxxxxxxxxxxxxxxxx</code> ). Used to associate target subnets and configure VPN routing rules.
<code>--vpn-target-subnet-ids</code>	✓	<code>&lt;VPN_TARGET_SUBNET_IDS&gt;</code>	Comma-separated list of subnet IDs within the VPN VPC to which the Client VPN endpoint is associated, determining which AZs VPN traffic can ingress through.
<code>--pni-hub-vpc-cidr</code>	✓	<code>&lt;PNI_HUB_VPC_CIDR&gt;</code>	CIDR block of the Confluent PrivateLink Network Interconnect (PNI) Hub VPC (e.g., <code>10.x.x.x/xx</code> ). This CIDR is injected as a route destination into the TFC Agent and VPN VPC route tables so traffic destined for Confluent endpoints is properly directed through the Transit Gateway.

All 13 arguments are required, the script exits with code 85 if any are missing.

The script will:

1. Authenticate to AWS SSO and export temporary credentials.
2. Export all `TF_VAR_*` environment variables.
3. Run `terraform init`, `terraform plan`, prompt for confirmation, then `terraform apply`.
4. Generate a Terraform graph visualization at `docs/images/terraform-visualization.png`.

## 6.2 Destroy

```
./deploy.sh destroy --profile=<SSO_PROFILE_NAME> \
    --confluent-api-key=<CONFLUENT_API_KEY> \
    --confluent-api-secret=<CONFLUENT_API_SECRET> \
    --tfe-token=<TFE_TOKEN> \
    --tgw-id=<TGW_ID> \
    --tgw-rt-id=<TGW_RT_ID> \
    --tfc-agent-vpc-id=<TFC_AGENT_VPC_ID> \
    --tfc-agent-vpc-rt-ids=<TFC_AGENT_VPC_RT_IDS> \
    --vpn-vpc-id=<VPN_VPC_ID> \
    --vpn-vpc-rt-ids=<VPN_VPC_RT_IDS> \
```

```
--vpn-endpoint-id=<VPN_ENDPOINT_ID> \
--vpn-target-subnet-ids=<VPN_TARGET_SUBNET_IDS> \
--pni-hub-vpc-cidr=<PNI_HUB_VPC_CIDR>
```

Here's the argument table for `deploy.sh destroy` command:

Argument	Required	Placeholder	Description
<code>--profile</code>	✓	<code>&lt;SSO_PROFILE_NAME&gt;</code>	AWS SSO profile name used to authenticate via <code>aws sso login</code> and derive the AWS region and account ID for the session.
<code>--confluent-api-key</code>	✓	<code>&lt;CONFLUENT_API_KEY&gt;</code>	Confluent Cloud API key used by Terraform to authenticate against the Confluent provider.
<code>--confluent-api-secret</code>	✓	<code>&lt;CONFLUENT_API_SECRET&gt;</code>	Confluent Cloud API secret paired with the API key for Terraform provider authentication.
<code>--tfe-token</code>	✓	<code>&lt;TFE_TOKEN&gt;</code>	Terraform Enterprise/Cloud (TFE/TFC) API token used to authenticate the Terraform Cloud Agent with the TFC control plane.
<code>--tgw-id</code>	✓	<code>&lt;TGW_ID&gt;</code>	AWS Transit Gateway ID (e.g., <code>tgw-xxxxxxxxxxxxxxxxxx</code> ) that serves as the central hub routing traffic between the TFC Agent VPC, VPN VPC, and the PrivateLink Network Interconnect (PNI) Hub VPC.
<code>--tgw-rt-id</code>	✓	<code>&lt;TGW_RT_ID&gt;</code>	AWS Transit Gateway Route Table ID (e.g., <code>tgw-rtb-xxxxxxxxxxxxxxxxxx</code> ) to which routes are added for inter-VPC traffic through the Transit Gateway.
<code>--tfc-agent-vpc-id</code>	✓	<code>&lt;TFC_AGENT_VPC_ID&gt;</code>	VPC ID of the VPC hosting the Terraform Cloud Agent (ECS Fargate). This VPC is attached to the Transit Gateway for connectivity to the Confluent Private Network.
<code>--tfc-agent-vpc-rt-ids</code>	✓	<code>&lt;TFC_AGENT_VPC_RT_IDS&gt;</code>	Comma-separated list of route table IDs within the TFC Agent VPC. Routes to the PNI Hub VPC CIDR are injected into these tables to enable PrivateLink reachability.

Argument	Required	Placeholder	Description
<code>--vpn-vpc-id</code>	✓	<code>&lt;VPN_VPC_ID&gt;</code>	VPC ID of the VPC where the Client VPN endpoint is deployed, allowing operator/admin connectivity into the private network.
<code>--vpn-vpc-rt-ids</code>	✓	<code>&lt;VPN_VPC_RT_IDS&gt;</code>	Comma-separated list of route table IDs within the VPN VPC. Routes to the PNI Hub VPC CIDR are added here so VPN-connected clients can reach Confluent Private Network.
<code>--vpn-endpoint-id</code>	✓	<code>&lt;VPN_ENDPOINT_ID&gt;</code>	AWS Client VPN Endpoint ID (e.g., <code>cvpn-endpoint-xxxxxxxxxxxxxxxxxx</code> ). Used to associate target subnets and configure VPN routing rules.
<code>--vpn-target-subnet-ids</code>	✓	<code>&lt;VPN_TARGET_SUBNET_IDS&gt;</code>	Comma-separated list of subnet IDs within the VPN VPC to which the Client VPN endpoint is associated, determining which AZs VPN traffic can ingress through.
<code>--pni-hub-vpc-cidr</code>	✓	<code>&lt;PNI_HUB_VPC_CIDR&gt;</code>	CIDR block of the Confluent PrivateLink Network Interconnect (PNI) Hub VPC (e.g., <code>10.x.x.x/xx</code> ). This CIDR is injected as a route destination into the TFC Agent and VPN VPC route tables so traffic destined for Confluent endpoints is properly directed through the Transit Gateway.

All 13 arguments are required, the script exits with code 85 if any are missing.

Destroy runs `terraform destroy -auto-approve` and regenerates the visualization.

## 7.0 Outputs

Output	Description
<code>confluent_pni_hub_gateway_id</code>	ID of the <code>confluent_gateway</code> resource (PNI Hub)
<code>confluent_pni_hub_access_point_id</code>	ID of the <code>confluent_access_point</code> resource
<code>confluent_environment_id</code>	ID of the Confluent Cloud environment where clusters are provisioned

Output	Description
<code>confluent_sandbox_cluster_id</code>	ID of the sandbox Kafka cluster ( <code>confluent_kafka_cluster</code> )
<code>confluent_shared_cluster_id</code>	ID of the shared Kafka cluster ( <code>confluent_kafka_cluster</code> )

## 8.0 Security Design

**Security Group (PNI ENIs):** Ingress-only on ports `443` (HTTPS/REST/Schema Registry) and `9092` (Kafka), sourced from the PNI Hub VPC CIDR, TFC Agent VPC CIDR, VPN VPC CIDR, and Client VPN CIDR. **No egress rules are defined**, which causes Terraform to revoke AWS's default `0.0.0.0/0` egress — intentionally mirroring PrivateLink's unidirectional behavior and preventing Confluent-initiated connections into the customer network.

**Network ACL:** Allows TCP ingress on `443`, `9092`, and ephemeral ports `1024–65535`. Allows all egress.

**ENI Permissions:** `aws_network_interface_permission` grants Confluent's AWS account `INSTANCE-ATTACH` permission on each customer-owned ENI. This is the core PNI handshake — Confluent attaches its broker VMs to your ENIs without your traffic ever leaving the AWS backbone.

## 9.0 How PNI Differs from PrivateLink

Aspect	PrivateLink	PNI
ENI ownership	Confluent's account	<b>Customer's account</b>
DNS	Requires PHZ + VPC associations	Confluent manages DNS
Connectivity model	VPC Interface Endpoint	ENIs registered via <code>confluent_access_point</code>
Egress control	Unidirectional by design	Explicit empty egress on SG required
Port 53 (DNS) rules	Required in SG	<b>Not needed</b>
